
PV Panel
- recive temperature from csv-api
- recive irradiance from csv-api
- calculate Pdc output based on PvsT curve and pmpp
- return Pdc output
Inverter
- recive Pdc from pv-panel-api
- recive voltage measuremente from grid
- calculate energy conversion and constraits control (i.e. volt-var control)
- Return Pac and/or Qac output
RegControl
- recive current measurements from grid
- recive voltage measurements from grid
- determine TAP position based on regulation band, time delay
- Return TAP command

Tap
ESSs
- recive Pdc and/or Qac charge/discharge set-point
- update SoC based on losses and efficency
- Return Pdc and/or Qac charge/discharge
OpenDSS
- recive Pac from pv-inverter
- recive Pac from ESSs
- recive Tap command from RegControl
- Run power flow simulation
- Return measurements signals
ESSs Control
- recive signal control
- trigger based on charge trigger and discharg trigger
- Return Pdc and/or Qac charge/discharge set-point
